

28-02-2026

Agenda:

pandas

Git

Group-1 Group-2 Group-3 Group-4

N1 N4 N5 N6 → Dataset
N2 ↓ ↓ ↓
N3 attributes attributes attributes

each of the students has their own attributes, that is they belong together.

(All total students)

if I pass each person's attributes → ML-model (learn based on 6 student) → My ML model should tell me that they belongs to which group

this is called as

Classification

ML doesn't understand text, so it converted to numbers

(1,1,1) → Group-1 → 1
Group-2 → ML → 2
Group-3 → 3
Group-4 → 4
Group → categories (numerical) } encoding

"A"

"B" → Character / String → pandas → D → A

"C"

"D"

D
C
B
A

A . . . 2

16

strings doesn't hold the sequence but number does.

"Two" > "first" : True

String $\rightarrow$ converted $\rightarrow$ type $\rightarrow$ to handle order
 $\downarrow$
 logic

event	date	ticket_id	price
concert	2028-02-02	—	—
—	—	—	—
—	—	—	—
conference	—	—	—

Data analysis $\rightarrow$ conclusion $\rightarrow$

rows → date → 2026-02-02

```

graph TD
    string --> year
    string --> month
    string --> day
    string --> weekday

```

row) $\rightarrow$ 02-02-2026 $\leftrightarrow$ 28-02-2026

→
str

Jan-1 → new year

→ today Jan-30

new year — today → -

holi — today → +

Git :- Tools to manage code

online: repo → github

D1:

local → git
code

↑ git init

→ git add .

→ git commit -m "abc"

→ git branch -M main

1st time thing

→ git remote add origin
url of the repo

→ git push -u origin main

D2:

git clone url-of-repo

D2: → uploaded files using github UI → .txt → github → online

github online

f1

f2

local repo

f1

→ git pull origin branch-name

↓
main

log off

↓

log in

git pull

project-1

study-1
